SUMMARY

Recent M.S. Computer Science graduate from The George Washington University (May 2026, GPA 3.77) looking for a data analyst, data engineer, or analytics role. Over the past year, I have worked with client and survey data at a nonprofit, helped build an AI powered LinkedIn tool at a startup, and shipped CleanCare, a solo project joining CMS nursing home, hospital, and ambulatory surgical center data into one platform with an AI chat assistant on top. Comfortable moving between SQL, Python, and PostgreSQL for the data work itself, and Tableau, Power BI, or Streamlit once it is time to explain what the data actually means to someone who has to act on it.

WORK EXPERIENCE

Thaddeus Resource Center

USA

Data Science Intern

November 2025 - Present

- Consolidated call, intake, and CRM data from multiple disparate systems into unified datasets covering over 100 clients using Python and SQL, validating data integrity as the pipeline scaled to about 1,000 weekly responses.
- Led a database migration project as team lead, coordinating weekly meetings and moving the organization's records from Microsoft Teams into organized SharePoint and Microsoft Lists.
- Presented client satisfaction and intern survey findings directly to the organization president and department heads, turning raw data into clear recommendations for program improvement.

Wavess AI

USA

AI Intern

August 2025 - November 2025

- Built and deployed a LinkedIn post automation tool end to end using Python and the OpenAI API, supporting 2 live business clients and onboarding a third.
- Gathered requirements from about 10 business clients covering differing topics, languages, and preferred posting styles, translating each request into a working feature added to the platform roadmap.
- Reduced manual content writing work by 40 to 50 percent by designing a tone, emoji, and image selection system that automatically generated two tailored draft posts for each client to choose from.

The George Washington University

USA

Support Assistant

January 2025 - May 2026

- Tracked circulation data across more than 50,000 records, identifying heavy borrowing patterns and monitoring on time returns and fine revenue.
- Designed dashboards visualizing circulation demand, fines, and inventory patterns, giving library leadership a clear view of usage trends during high traffic periods like midterms and finals.
- Supported researchers with data cleaning and collection for their own projects while communicating directly with students about their resource needs.

PricewaterhouseCoopers (PwC)

Bangalore, India

CRM Intern

February 2024 - August 2024

- Managed user roles and permissions across more than 10,000 Salesforce records for a healthcare client, supporting accurate access control throughout a multi month engagement with the client's IT team.
- Authored more than 20 QA validation documents with before and after screenshots, standardizing the data quality review process the team still uses across reporting cycles today.
- Delivered custom Salesforce reports and dashboards giving senior stakeholders clear, decision ready views of program performance during client meetings.

TECHNICAL PROJECTS

CleanCare [\[GitHub\]](#)

June 2026 - Present

- Developed CleanCare, a solo PostgreSQL platform joining CMS data on nursing homes, hospitals, and ambulatory surgical centers, exposing facility quality patterns through a 19 tool MCP server, an AI chat assistant, and a web dashboard, backed by 128 automated tests running in CI.

Academic Paper Recommendation System [\[GitHub\]](#)

March 2026 - May 2026

- Engineered a hybrid recommendation system combining BERT, Node2Vec, and BM25 across 23.4 million research papers and 278 million citation edges, applying product quantization to cut the FAISS index size by 97 percent.

U.S. Airline On Time Performance Pipeline [\[GitHub\]](#)

January 2026 - March 2026

- Created an ETL pipeline ingesting 50 million flight records across 200 plus airlines into PostgreSQL, then deployed interactive Streamlit and Tableau dashboards letting users select departure, destination, and date for airline recommendations.

FAERS Drug Symptom Safety Analysis [\[GitHub\]](#)

August 2025 - November 2025

- Extracted, validated, and standardized 1 million plus drug names across 18 million FDA adverse event records from disparate source files, powering a FastAPI and DuckDB backend that surfaces drug symptom co occurrence and dosage risk patterns.

TECHNICAL SKILLS

Programming & Querying: Python, SQL, R, Java, HTML, CSS

Data Engineering & Pipeline: ETL Pipelines, Docker, Pandas, NumPy, Scikit learn, DuckDB, SQLite, Data Validation and Cleaning

Data Visualization & BI: Power BI, Tableau, Plotly, Matplotlib, Seaborn, Streamlit

Databases, Cloud & Tools: PostgreSQL, MySQL, AWS, Git, GitHub Actions, Jira, Salesforce, Microsoft Office, FastAPI, Command Line

EDUCATION

The George Washington University

Washington, DC

Master of Science in Computer Science

May 2026

GPA: 3.77 | Honors: SEAS Merit Award

Courses: Neural Networks and Deep Learning, Advanced Machine Learning, Database Systems II, Cloud Computing
